LOOP & GRAPH ENGINEERING

Same model. Better system.

A better model alone changes little. The system around it does the work: a harness that keeps every step on track, a graph that joins the steps, and loops that check the work and learn from real results. Shown on the Clip Factory, the media operation I built and run on Anthropic's Claude.

PROMPT → **AGENT** → **HARNESS** → **LOOP** → **GRAPH** Each one wraps the one before. Below, all five at work.

Inner loops change numbers. Outer loops change rules. Only a person changes taste.

SEVEN PARTS OF A LOOP

the clip loop, filled in

1	**START**	The critic says FIX.
2	**GOAL**	The clip passes the critic.
3	**MEMORY**	The critic's notes and the clip's past calls.
4	**ALLOWED**	Only the fixer's safe fixes, never a recut.
5	**PROOF**	The critic checks again. A maker never grades itself.
6	**FEEDBACK**	The critic's reason goes back to the fixer.
7	**STOP**	Two rounds, then a person decides.

15 scheduled Claude jobs checked on all seven: 101 of 105 in place.

EVIDENCE, NOT CONFIDENCE

measured November 2026

6

Reels a day is all Facebook shows a Page this size. The first two drew 94% of views, so the best clip now leads.

33

real past jobs rerun before an engine change ships. The first replay: 0 new failures.

36%

of the time the AI critic agreed with my calls. So its gate stays in shadow until it reaches 70% across 12 calls.

402

gate refusals in 7 days, counted by rule. The top 3 now open every night's run, each with its rule.

THE SAME LOOP FITS ANY SYSTEM

Clips are just the easiest to show. Any system: data in, a decision, data out, a check.

	DATA IN →	DECISION →	DATA OUT →	PROOF
MEDIA	Streams, video, news	Which moment to cut	A posted clip	Views at 24 hours
ENERGY	Load, prices, weather	When to buy, store or run	A dispatch schedule	Real cost against forecast
FINANCE	Prices, filings, news	Which idea to test	A signal or a trade plan	Returns on data it never saw
OPERATIONS	Orders, tickets, invoices	What to route, flag or fix	An action or a report	Errors caught, time saved
ANY SYSTEM	**Whatever comes in**	**What to do with it**	**Whatever goes out**	**A check, never the agent's word**

A system like this, in any niche, running on its own 24/7, is where the value in AI lies.

The more compute you own, the more loops you run, and the deeper each one goes.

My own logs show it. Today a weekly usage cap decides how many loops run, and when it ran out on 25 October a whole night of clips was lost. On local hardware the loops run day and night with no meter, and each decision can test 30 versions instead of one.
